***DETAILED ACTION***

1. This Office Action is the answer to the IDS received on 5/27/2005, which paper has been placed of record in the file.
2. Claims 1-33 are pending in this application.

***Drawings***

3. The submitted drawings are acceptable for examining purposes.

***Claim Rejections - 35 USC § 112***

4. Claims 1-33 are objected to because of the following informalities in independent claims: “unmanned aerial vehicle (UAV)” should be used instead of just “UAV”.  
Appropriate correction is required.

***Claim Rejections - 35 USC § 112***

The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

5. Claims 12, and 23 are rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement. The claims contains subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventors, at the time the application was filed, had possession of the claimed invention. That description is: “means for piloting the UAV” (a low level block as “Piloting the UAV to the way point in accordance with a navigation algorithm – 410” in Figure 4 or, “Co-pilot.TM. from FMA” in para. [0060] is not proper for a claimed feature of “means for piloting”).
6. Dependent claims 13-11, and 24-33 are rejected also because they incorporate above deficiencies from their parent claims 12, and 23.

***Claim Rejections - 35 USC § 103***

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all

obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(f) or (g) prior art under 35 U.S.C. 103(a).

7. Independent claims 1, 12, and 23 are rejected under 35 U.S.C. 103(a) as being unpatentable over Applicant Admitted Prior Arts (here in after AAPAs), in view of DeLorme et al (US Pat. 5,986,604).

AAPAs teach about remotely controlling an UAV; the applicants also show a disadvantage of the prior art is the use of a camera to control an UAV (see the specification, the background portion).

However, DeLorme et al. teach about not using a camera to guide an object with a computer screen (GUI) map pixel to Earth's coordinates that represents a waypoint for navigation, the pixel having a location on the computer screen (GUI) (see DeLorme et al., Fig.2 and col.30, lines 19-25, and col. 37 lines 8-12).

Therefore, it would have been obvious to one of ordinary skill in the art at the time of invention to implement AAPAs' knowledge with the teachings of DeLorme et al. in order to remotely control an UAV without using a camera because it is simpler, and more accurate to remotely navigation an object with short commands by piloting with coordinates of waypoints and a destination.
